

- Replace “Text Analyzer” with “Title”. “Enter your text” with “Enter your story ...”. “Analyze” with Next. Also give an option to choose from few **pre written stories** that are shown as cards above “Next” button at the bottom.
- First time load , use tooltips to guide the user. (optional for now)

- Keep navigation arrows in **header** itself. Replace “Summary” with “Select and Style Image”. Keep navigation arrows like < Select and Style Image >.
- Keep 1-1 of 3 **underneath** “select and style”.
- If you can design such that image editing and stylization is in its **own new page** that is ideal but not mandatory.
- Instagram/Prisma style underneath **image slider cards** with name and style sample image. For style sample image resize and use from <https://drive.google.com/drive/folders/0B3gpzFo57QfwTHY0ZVF5YnhoQ28>
- Instagram and Prisma style is good for mobile but for desktop we can use something similar to google photos as shown below with styles on the right.

- Instead of back to images, use a **close button** to the top right of image. **Tooltip** hover should read “cancel and select a new image”
- At the bottom there should be “**Proceed with this style**” or “Use this style” which also takes to next page.
- There should be **no view article** on **each page**. It should be there on only **last page**.
- Last page should have “**Finish and view**” at the bottom.
- The view article should have **centered images** with the text. Right now it doesn't seem so. Also good **padding/border** between images and text. Use the same fonts as medium for now or go to fonts.google.com and check do heading and content trials. When **heading is sans-serif** we should have **serif in content** and vice versa. Search for Fonts for technology etc if you want to know more.

Also for the view article the meta data or json content should look like the below. Try to see info(i) on any image in google photo

Also google **Amazon Xray** in prime video and you will get some youtube links for commercials. You can take inspiration from it too for view.

The view **right side** should be a **fixed snippet** that changes content as you scroll.

At the bottom of the view page there should be a **download as pdf** choice to download the story as pdf.

Use slider like the one shown here on original and stylized image :

Pravjeeth Points

Adding widget to handle text area , which could be helpful in selecting the text length , making bold , and font size . Colour coding etc

Selecting images will be have similar kind of look and feel like <https://www.captionbot.ai/> , where horizontally images will be targeted .

Home page should have more appealing adding some widgets , I will create few sketch mock , or balsamiq mock to finalise , after finalise development will be done .

Read more , read less should be button with icon change , (+ and -) icon .

Tags should be multi colour for better ux

Quick links in footer

Save and publish sections .

Making Ux more friendly (this will be brain storming process which could be mutually handled)
